

REPLACEMENT SHEET

AMPLITUDE AND PHASE MATCHING FOR LAYERED MODULATION RECEPTION

ABSTRACT OF THE DISCLOSURE

An apparatus and method for receiving layered modulation signals is disclosed. A typical
5 method includes receiving a layered modulation signal including an upper layer signal and a lower
layer signal, demodulating and decoding the upper layer signal from the received layered
modulation signal, estimating an upper layer amplitude factor and an upper layer phase factor
from the received layered modulation signal. A substantially ideal upper layer signal is
reconstructed from the demodulated and decoded upper layer signal including matching an ideal
10 amplitude and an ideal phase by applying the upper layer amplitude factor and the upper layer
phase factor to the reconstructed ideal upper layer signal. Finally, the reconstructed ideal upper
layer signal is subtracted from the received layered modulation signal to produce the lower layer
signal for processing.
